PROFESSIONAL SUMMARY

Platform Engineer specialising in designing, building, and operating secure, scalable, and automated cloud infrastructure across Azure and AWS environments. Experienced in Infrastructure as Code, Kubernetes platforms, CI/CD automation, and DevSecOps practices to deliver reliable and resilient cloud services. Strong expertise in developing reusable Terraform modules, implementing GitOps workflows, integrating security controls into delivery pipelines, and improving observability through modern monitoring solutions. Passionate about enabling engineering teams through standardised platform capabilities, automation, and continuous improvement while balancing security, reliability, performance, and cost.

CORE SKILLS

Cloud & Platform Engineer: Microsoft Azure, AKS, Virtual Networks, Private Networking, Azure Entra ID, Azure Key Vault, Azure Monitor, Log Analytics, Cloud Architecture, Platform Engineering

Infrastructure as Code : Terraform v1.5.10, Terraform Modules, Remote State Management, Infrastructure Automation, Ansible

Containers & CI/CD: Kubernetes, Docker, Argo CD, GitHub Actions, Azure DevOps, Jenkins, GitOps, Continuous Integration, Continuous Delivery

Programming & Scripting: Python, Bash, PowerShell, YAML, Git

Observability & Operations: Prometheus, Grafana, Monitoring & Alerting, Incident Management, Root Cause Analysis, Service Reliability, Disaster Recovery

Security & DevSecOps: RBAC, OIDC Federation, Azure Workload Identity, Zero Trust Principles, Checkov, Trivy, SonarCloud, Vulnerability Management, Secrets Management

PROFESSIONAL EXPERIENCE

Platform / DevOps Engineer

Nimbus Compute — Remote, UK

May 2025 – Present

- Designed and maintained secure Azure infrastructure using Terraform, creating reusable modules and standardised Infrastructure as Code patterns across environments.
- Built and operated CI/CD pipelines using GitHub Actions, Azure DevOps, and Jenkins to automate infrastructure validation, security checks, and deployments.
- Managed Kubernetes-based platforms using AKS, implementing secure networking, RBAC, workload identity, and scalable deployment patterns.
- Implemented GitOps workflows with Argo CD, improving deployment consistency and reducing configuration drift.
- Integrated DevSecOps controls including Checkov, Trivy, and SonarCloud to identify security and compliance issues early in the delivery lifecycle.
- Improved operational visibility using Azure Monitor, Log Analytics, Prometheus, and

Grafana to support monitoring, incident investigation, and continuous improvement.

- Collaborated with development and security teams to implement reliable, secure, and cost-effective cloud solutions.

DevOps Engineer

Matt Fitness - Abuja, Nigeria.

2019 - 2023

- Automated deployment processes and improved software delivery using CI/CD practices, scripting, and infrastructure automation.
- Supported cloud environments, containerised workloads, monitoring, and operational improvements to maintain reliable services.
- Worked closely with developers and stakeholders to troubleshoot issues and improve application reliability and delivery processes.

Selected Platform Engineering Project

Secure Azure Kubernetes Platform | Terraform | AKS | GitHub Actions |

DevSecOps

Designed and implemented a secure, production-style Azure platform using Infrastructure as Code and automated delivery pipelines.

- Provisioned AKS, Virtual Networks, Network Security Groups, Azure Container Registry, Key Vault, monitoring resources, and secure operational access using reusable Terraform modules.
- Implemented remote Terraform state management with environment separation to enable consistent and reliable deployments.
- Configured GitHub OIDC federation, Azure RBAC, Kubernetes RBAC, and Azure Workload Identity to enforce least-privilege access and remove long-lived credentials.
- Built CI/CD workflows with automated Terraform validation, security scanning, approval controls, and infrastructure deployment.
- Integrated monitoring and alerting using Azure Monitor, Log Analytics, Prometheus, and Grafana to support reliability and operational visibility.
- Enabled disaster recovery through version-controlled Infrastructure as Code, resilient state management, and repeatable platform rebuild processes.

EDUCATION

B.Sc. Transport & Logistics Management
